2026-2027

— THE CITATION

High-quality construction and a powerful and precise performance are on offer from ESX's VE1000.6SP amplifier. This six-channel model supplies 2 x 100W into 4 ohms, and 4 x 200W into 2 ohms, while maintaining an extremely low distortion of 0.005% at 1W for a clean and detailed reproduction. The digital section incorporates Velvet Sound converters from AKM on the input and output, in addition to an Analog Devices DSP operating at 96kHz – this processor's advanced functions are managed by ESX's Toolkit DSP application. Thanks to its six powered channels and six pre-out channels, the amplifier provides the flexibility needed to create a variety of systems. And beyond the specifications, the VE1000.6SP stands out for its ability to control any type of speaker, offering a dynamic response, natural tonality and a warmth rarely found in a Class D design.
